Abstract:

There is no doubt Smart City is coming. Regardless of its various definitions, there are visible attempts to implement and use new technologies to monitor and record almost every fact associated with something we may call a city organism. Big data, artificial intelligence, ambient information sharing, 3D visualization, and modelling, ... all such technologies can either improve the ability of the City to grow and survive or contribute to the potential collapse. Discussion of Pros and Contras of the Smart City phenomena will be a subject of this paper.

Keywords: crisis management, smart city, security
