Abstract

The pre-accident awareness is sort of magic subject. An area of prophets, fortune-tellers, but also statistics, analysts, psychologists and forensic officers. The case is simple - "After the battle, everyone is a general" as an old saying declares. After the disaster everybody knows that it was evident that this would inevitably happen. But before it happens, it is hard to identify those faint markers, which signal the future shock.

But there is a way how to improve ... to collect the experience and build it to models which can provide an early warning.

The project of rocks crashings, concluded in the Czech Republic is an attempt to approach the pre-accident conditions detection and awareness. But there are other chances, how to sense that "something is in the air" and recognize the potential escalation of emergency.

Keywords: pre-accident awareness, crisis management, risk, emergency
